

Paragraphs (separated by " | "): {" | ".join(newSentences)}

Instructions:

Inside each Paragraph, identify all context words/phrases and output a JSON dictionary with full Paragraph texts as keys and lists of {[context type]: [corresponding words/phrases as a list of values (more than one possible)]} as values.

Other context types are self-explanatory.

Only output the resulting JSON.

Listing 2: A representation of “Context Prompt” (Prompt 2) for identifying context from the provided text and augmenting the original triples with the extracted information.
